Service Ticket System

Your workshop's job board. The front desk types the order once, technicians see it straight away on a tablet, and the front desk hears a chime when the car is ready.

October 2026

01 What it does

The system replaces the printed job order with a live screen that the front desk and the workshop share.

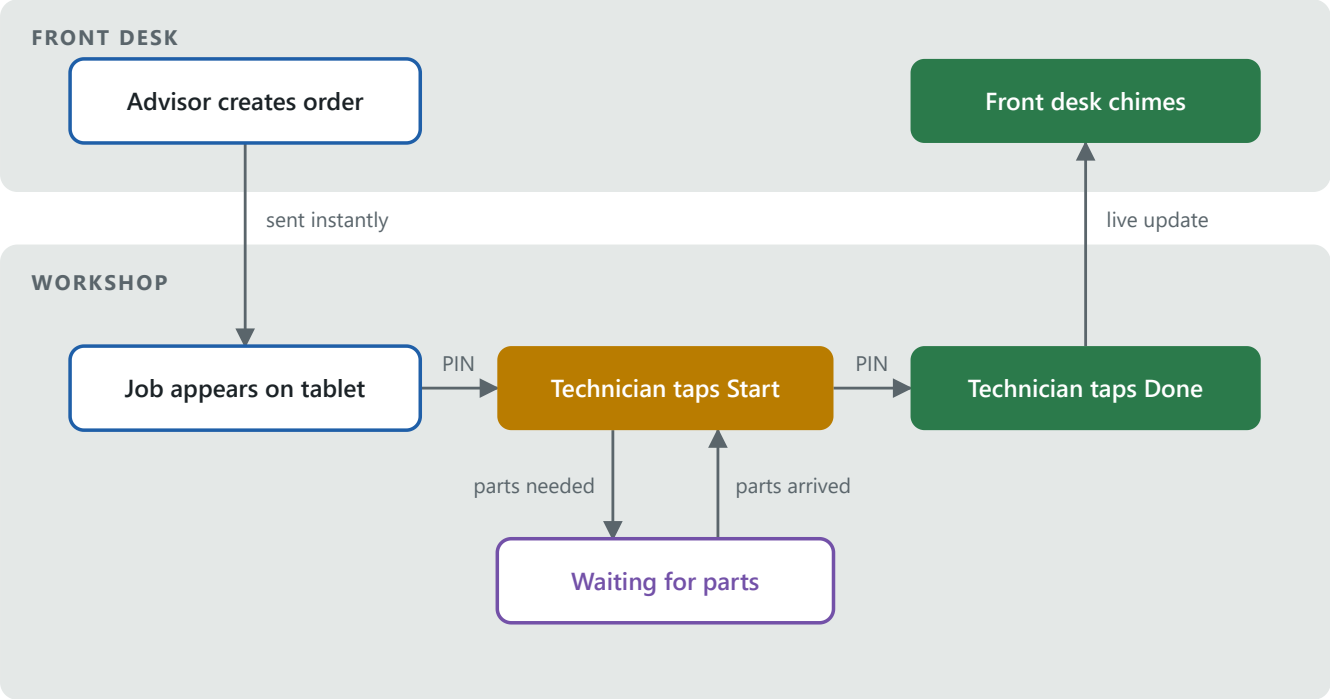

Today, on paper

- The order is written and walked downstairs.
- To ask "is the car ready?", someone walks down or calls.
- Photos of damage sit on different phones.
- Hard to see later who did the job.

With the system

- The advisor types the order once; it is on the workshop tablet within a second.
- The technician taps Start and Done.
- The front desk hears a chime, with the customer's name and phone ready.
- Who did what, photos and voice notes stay with the job.

How a car moves through the workshop

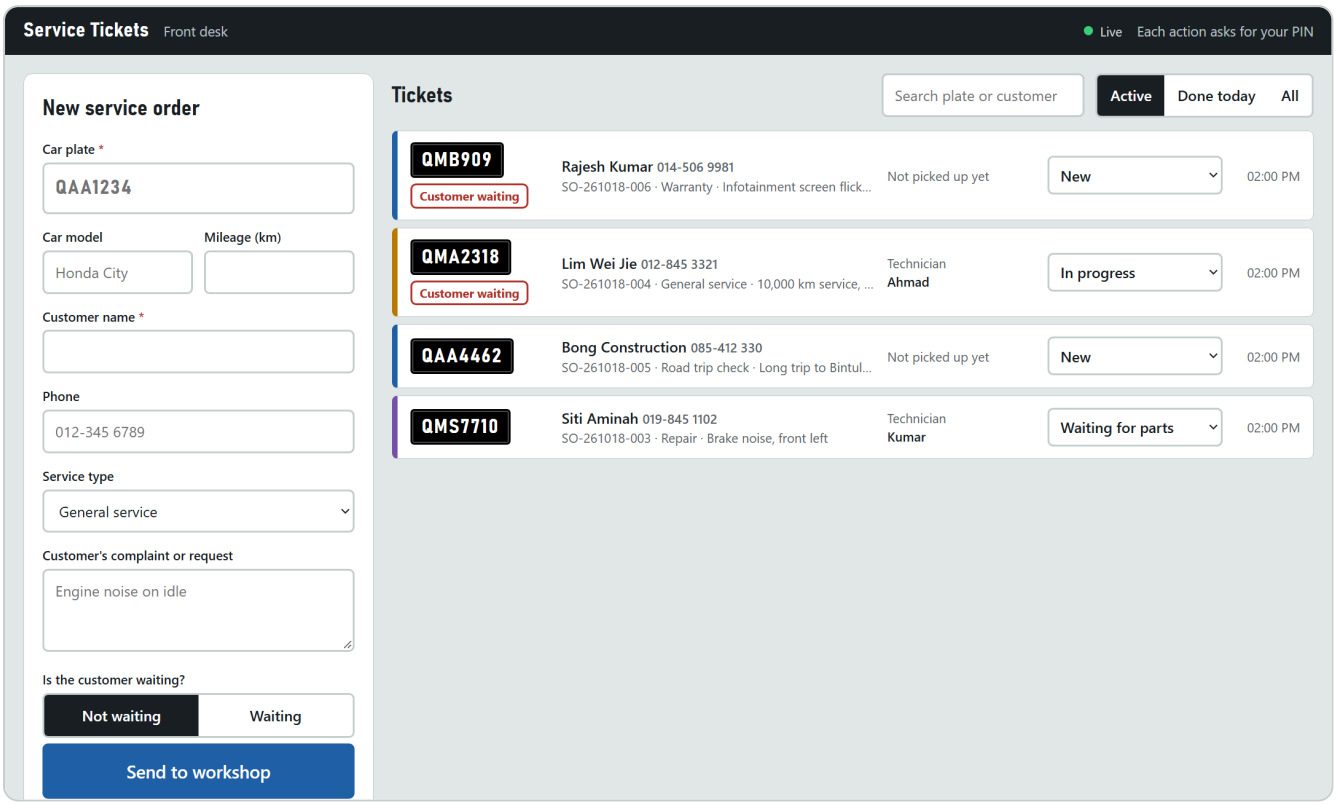

Every change appears on all screens by itself. Photos, 360° photos and voice notes can be added to the job at any step.

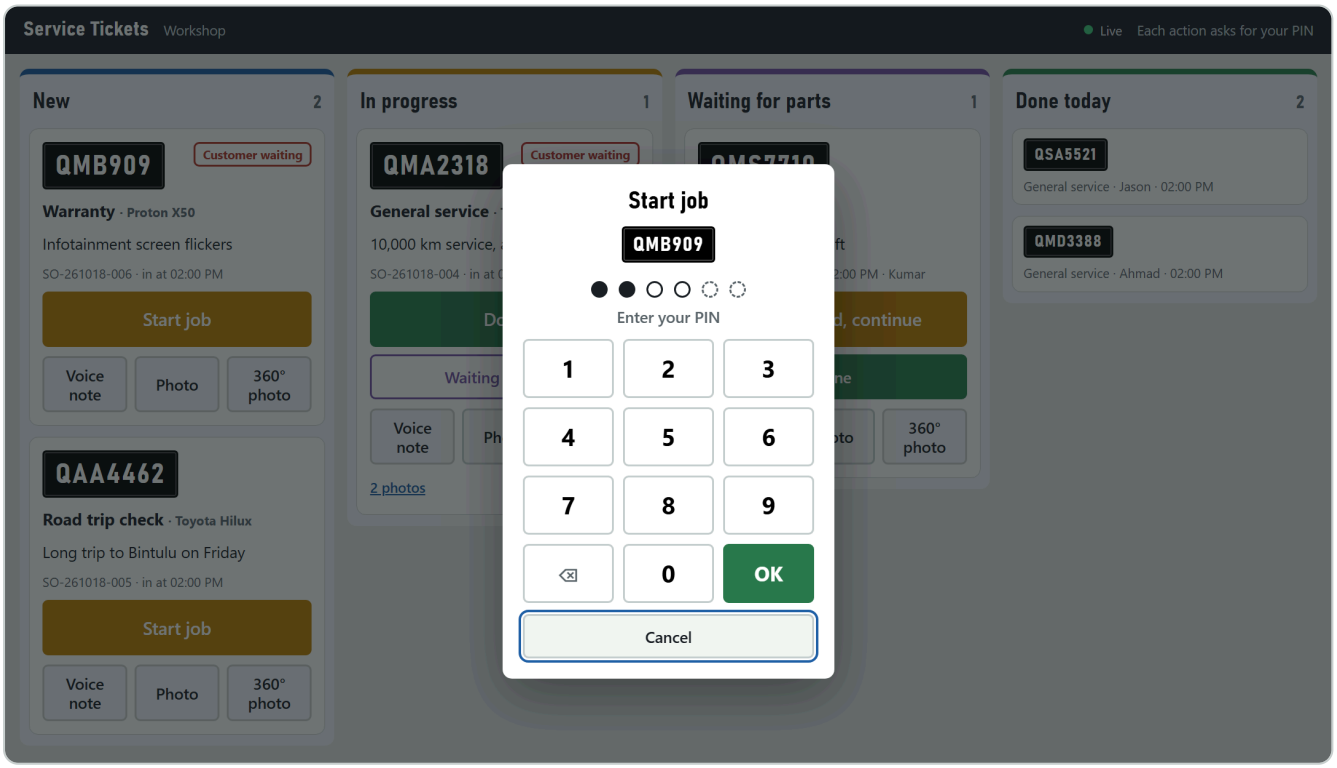

> **Works alongside your accounting system.** Your accounting or ERP software stays the official record for billing and parts. This system runs the daily flow on the workshop floor.

02 The screens

Two main screens, shown here with sample jobs.

Front desk. New order on the left; every car in the workshop on the right, with its technician and status. Customers who are waiting are marked in red.

Workshop, with the PIN pad open. Four lanes: New, In progress, Waiting for parts, Done today. Each action asks for the person's own PIN, so the history shows who did it.

03 Main features

New service order
Plate, model, mileage, customer, phone, service type, complaint, and whether the customer is waiting. The order number (e.g. SO-261018-001) is made automatically.

Live job board
Four lanes: New, In progress, Waiting for parts, Done today. Big Start, Parts and Done buttons, easy to tap with gloves.

Done chime
When a job is done, the front desk plays a chime and shows the customer's name and phone number.

Ticket window
Tap a ticket on either screen: details, a history of who created, started and finished it (with times), photos and voice notes.

Photos
Taken with the tablet or phone camera, marked before, during or after work. After Send to workshop, the ticket opens for intake photos of existing scratches.

360° photos and voice notes
360 photos: drag to look all around the car. Voice notes: speak instead of typing.

Staff PINs
Each person confirms an action with their own PIN. The history shows who did what and when.

Search and filters
Find a car by plate or customer name. Show active jobs, done today, or all.

Admin page
Add staff, set PINs, change roles, disable someone who left.

Your name, logo and licence
Your brand name and logo in the top bar of every screen. A 14-day trial (5 staff) until the admin enters the licence key.

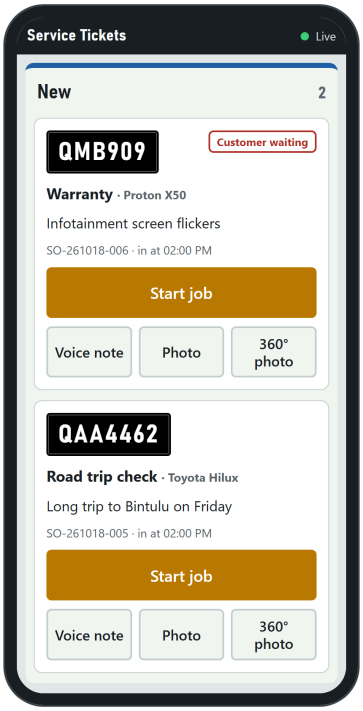

04 Who uses it

Everyone shares the same screens. Nobody logs in or out: each person types their own PIN when they do something.

Role	Can do
Service advisor	Create orders, change any job's status, add photos and voice notes.
Job controller	Same as an advisor, including changing a job a technician has already taken.
Technician	Start a new job, then work on their own jobs: waiting for parts, done, photos, voice notes. Cannot touch another technician's job.
Admin (owner or manager)	Add and disable staff, set and change PINs, enter the licence key, set the logo and shop address. The admin PIN only opens the Admin page.

05 Devices and network

One Windows PC in the shop runs the system. It is set up with one setup file and starts by itself with the PC. Every other device just opens a web page.

The workshop screen on a phone

Front desk

Any PC or laptop with a web browser.

Workshop

Android tablets (or any tablet) in a browser. Add it to the home screen and it opens like an app.

Inside the shop

Shop Wi-Fi or network cable. No internet needed for daily work.

Outside, on mobile data

E.g. at the customer parking. Phones with the free ZeroTier app connect privately to the shop PC. Only devices you approve can connect; nothing is open to the public internet.

Size

Built for small and mid-size workshops: a front desk, a few tablets, and dozens of cars a day.

06 Your data and safety

All data stays on your own PC in the shop, not in someone else's cloud.

One data folder

Orders, history, staff, photos, voice notes and your logo are in one folder on the server PC: C:\ProgramData\ServiceTicketSystem. Backing up = copying that folder. Updates keep it.

Personal PINs

4 to 6 numbers; easy PINs like 1111 are fine. No two people share one. Stored scrambled, so they can't be read from the data folder.

Wrong PINs

After 5 wrong tries, that device waits 30 seconds.

Staff who leave

Disable them on the Admin page. Their PIN stops working at once; their history stays.

> **Works alongside your accounting system.** It stays your official record; this system supports the daily work around it.

07 Coming next

Planned, not in the current version.

Feature	What it adds
Inspection form	Battery check, tyre size, brake pad thickness, saved with the job.
Your own statuses	Admin can add or rename statuses (New and Done stay fixed).
Backups	Backup Now button plus an automatic daily backup to a place you choose.
Automatic clean-up	Photos removed after 6 months and voice notes after 90 days; ticket text kept.
Recommend next service	Suggest the next service and repairs from the car's history.
Voice recording in the browser	Record straight in the page on tablets, instead of the recorder app.
